

Web Application Report

This report includes important security information about your web application.

Security report

This report was created by HCL AppScan Standard 10.7.0
Scan started: 12/9/2024 10:08:55 AM

Table of Contents

Introduction

- General Information
- Login Settings

Summary

- Issue Types
- Vulnerable URLs
- Fix Recommendations
- Security Risks
- Causes
- WASC Threat Classification

Issues Grouped by Issue Type

- NoSQL Injection 10
- Integer Overflow 8
- Check for SRI (Subresource Integrity) support 25
- Cookie with Insecure or Improper or Missing SameSite attribute 1
- Cross-Site Request Forgery 32
- Host Header Injection 1
- Temporary File Download 1
- Autocomplete HTML Attribute Not Disabled for Password Field 3
- Body Parameters Accepted in Query 11
- Missing "Content-Security-Policy" header 1
- Missing HttpOnly Attribute in Session Cookie 1
- Missing or insecure "X-Content-Type-Options" header 1
- Missing or insecure Cross-Frame Scripting Defence 1
- Application Error 28
- Email Address Pattern Found 7
- Internal IP Disclosure Pattern Found 4
- Missing "Referrer policy" Security Header 1
- Potential File Upload 2

How to Fix

- NoSQL Injection
- Integer Overflow
- Check for SRI (Subresource Integrity) support
- Cookie with Insecure or Improper or Missing SameSite attribute
- Cross-Site Request Forgery
- Host Header Injection
- Temporary File Download
- Autocomplete HTML Attribute Not Disabled for Password Field
- Body Parameters Accepted in Query
- Missing "Content-Security-Policy" header
- Missing HttpOnly Attribute in Session Cookie
- Missing or insecure "X-Content-Type-Options" header
- Missing or insecure Cross-Frame Scripting Defence
- Application Error
- Email Address Pattern Found
- Internal IP Disclosure Pattern Found
- Missing "Referrer policy" Security Header
- Potential File Upload

Application Data

- Cookies
- JavaScripts

Introduction

This report contains the results of a web application security scan performed by HCL AppScan Standard.

Critical severity issues:	10
High severity issues:	8
Medium severity issues:	59
Low severity issues:	18
Informational severity issues:	41
Total security issues included in the report:	138
Total security issues discovered in the scan:	138

General Information

Scan file name:	ric-web-full-slow
Scan started:	12/9/2024 10:08:55 AM
Test policy:	Default
CVSS version:	3.1
Test optimization level:	Normal
Host	192.168.10.242
Port	8180
Operating system:	Unknown
Web server:	Unknown
Application server:	JavaAppServer

Login Settings

Login method:	Automatic
Concurrent logins:	Enabled
In-session detection:	Enabled
In-session pattern:	/ric-web/servlet/signin/logout"
Tracked or session ID cookies:	JSESSIONID
Tracked or session ID parameters:	[JSESSIONID] [JSESSIONID]
Login sequence:	http://192.168.10.242:8180/ric-web

<http://192.168.10.242:8180/ric-web/>
<http://192.168.10.242:8180/ric-web/servlet/ric/welcome>

Fix Recommendations (17)

[TOC](#)

Remediation Task	Number of Issues	
H Ensure user input is of the correct type and escape it properly	10	
M Construct HTTP headers very carefully, avoiding the use of non-validated/unsanitized input data	1	
M Remove old versions of files from the virtual directory	1	
M Review possible solutions for configuring SameSite Cookie attribute to recommended values	1	
M Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form	32	
L Add the 'HttpOnly' attribute to all session cookies	1	
L Add to each third-party script/link element support to SRI(Subresource Integrity).	25	
L Config your server to use the "Content-Security-Policy" header with secure policies	1	
L Config your server to use the "Referrer Policy" header with secure policies	1	
L Config your server to use the "X-Content-Type-Options" header with "nosniff" value	1	
L Config your server to use the "X-Frame-Options" header with DENY or SAMEORIGIN value	1	
L Correctly set the "autocomplete" attribute to "off"	3	
L Do not accept body parameters that are sent in the query string	11	
L Remove e-mail addresses from the website	7	
L Remove internal IP addresses from your website	4	
L Restrict user capabilities and permissions during the file upload process	2	
L Verify that parameter values are in their expected ranges and types. Do not output debugging error messages and exceptions	36	

Security Risks 13

TOC

Risk	Number of Issues
C It is possible to view, modify or delete database entries and tables	10 
M Prevent cookie information leakage by restricting cookies to first-party or same-site context, Attacks can extend to Cross-Site-Request-Forgery (CSRF) attacks if there are no additional protections in place (such as Anti-CSRF tokens).	1 
M It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.	32 
M It is possible to deface the site content through web-cache poisoning	1 
M It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.	16 
M It is possible to download temporary script files, which can expose the application logic and other sensitive information such as usernames and passwords	1 
L It may be possible to bypass the web application's authentication mechanism	3 
L It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations	26 
L It may be possible to steal or manipulate customer session and cookies, which might be used to impersonate a legitimate user, allowing the hacker to view or alter user records, and to perform transactions as that user	1 
I It is possible to run remote commands on the web server. This usually means complete compromise of the server and its contents	2 
I It is possible to upload, modify or delete web pages, scripts and files on the web server	2 

Causes 18

TOC

Cause	Number of Issues
C Sanitation of hazardous characters was not performed correctly on user input	10 
G Proper bounds checking were not performed on incoming parameter values	36  
G No validation was done in order to make sure that user input matches the data type expected	36  
G SRI (Subresource Integrity) not supported	25 
M Sensitive Cookie with Improper or Insecure or Missing SameSite Attribute	1 
M Insufficient authentication method was used by the application	32 
M The web application performs a redirection to an external site	1 
M Temporary files were left in production environment	1 
L Insecure web application programming or configuration	31  
L The web application sets session cookies without the HttpOnly attribute	1

Issues Grouped by Issue Type

C NoSQL Injection 10

TOC

Issue 1 of 10

TOC

NoSQL Injection

Severity: Critical

CVSS Score: 9.4

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:L/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/registration/searchGroupCode>

Entity: searchGroupCode (Page)

Risk: It is possible to view, modify or delete database entries and tables

Cause: Sanitation of hazardous characters was not performed correctly on user input

Fix: Ensure user input is of the correct type and escape it properly

Difference: Body manipulated from:

```
{"pageNo":1,"pageSize":15,"status":"NOP","status-child1":"","regSiteCode":"","dayReceptionFrom":"","dayReceptionTo":"","dateReturnFrom":"","dateReturnTo":"","dateOfResultsFrom":"","dateOfResultsTo":"","dateOfReturnOfDocumentsFrom":"","dateOfReturnOfDocumentsTo":"","infoMationSearch":"","priority":""}
```

to:

```
{"pageNo":{ "$ne": "1" },"pageSize":{ "$ne": "1" }5,"status":"NOP","status-child{ \"$ne\": \"1\" }": "", "regSiteCode": "", "dayReceptionFrom": "", "dayReceptionTo": "", "dateReturnFrom": "", "dateReturnTo": "", "dateOfResultsFrom": "", "dateOfResultsTo": "", "dateOfReturnOfDocumentsFrom": "", "dateOfReturnOfDocumentsTo": "", "infoMationSearch": "", "priority": ""}
```

Reasoning: AppScan requested a file which is probably not a legitimate part of the application. The response status was 200 OK. This indicates that the test succeeded in retrieving the content of the requested file.

Raw Test Response:

```
...
"dateReturnTo": "",
"dateOfResultsFrom": "",
"dateOfResultsTo": "",
"dateOfReturnOfDocumentsFrom": "",
"dateOfReturnOfDocumentsTo": "",
"infoMationSearch": "",
"priority": ""
}
```

```
HTTP/1.1 200 OK
Connection: keep-alive
X-Powered-By: JSP/2.3
Content-Type: text/html;charset=UTF-8
Content-Length: 8942
```

...

Issue 2 of 10

NoSQL Injection

Severity:	Critical
CVSS Score:	9.4
CVSS Vector:	AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:L/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/ric-web/servlet/registration/searchHoSoBienNhan
Entity:	searchHoSoBienNhan (Page)
Risk:	It is possible to view, modify or delete database entries and tables
Cause:	Sanitization of hazardous characters was not performed correctly on user input
Fix:	Ensure user input is of the correct type and escape it properly

Difference: Body manipulated from: `{"soHoSo": "", "tenCanBo": "", "chungMinhThu": "", "date": "", "pageIndex": 1}` to: `{"soHoSo": {"$ne": "1"}, "tenCanBo": {"$ne": "1"}, "chungMinhThu": {"$ne": "1"}, "date": {"$ne": "1"}, "pageIndex": 1}`

Reasoning: AppScan requested a file which is probably not a legitimate part of the application. The response status was 200 OK. This indicates that the test succeeded in retrieving the content of the requested file.

Raw Test Response:

```
...
{
  "chungMinhThu": {
    "$ne": "1"
  },
  "date": {
    "$ne": "1"
  },
  "pageIndex": 1
}

HTTP/1.1 200 OK

TOC

Check for SRI (Subresource Integrity) support

Severity: Medium

CVSS Score: 5.3

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:N/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/registration/showRegistrationMain>

Entity: showRegistrationMain (Page)

Risk: In case the third-party server is compromised, the content/behavior of the site will change

Cause: SRI (Subresource Integrity) not supported

Fix: Add to each third-party script/link element support to SRI(Subresource Integrity).

Difference:

Reasoning: The third-party links/scripts don't have integrity attribute for the browser to confirm they were not compromised

Raw Test Response:

```

...
<script type="text/javascript"
src="resources/js/notify.js"></script>
<link rel="stylesheet" href="https://cdnjs.cloudflare.com/ajax/libs/simplePagination.js/1.6/simplePagination.css"

Cross-Site Request Forgery

Severity:	Medium
CVSS Score:	6.5
CVSS Vector:	AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/ric-web/servlet/RicIssue/showRicIssuance
Entity:	showRicIssuance (Page)
Risk:	It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.
Cause:	Insufficient authentication method was used by the application
Fix:	Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form

Difference: Header `Referer` manipulated from: <http://192.168.10.242:8180/ric-web/servlet/RicIssue/showRicIssuance> to:
<https://bogus.referer.hcl.com>

Header `Origin` added to request: <https://bogus.origin.hcl.com>

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Cross-Site Request Forgery

Severity: Medium

CVSS Score: 6.5

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/listSendQuery/showUploadSend>

Entity: showUploadSend (Page)

Risk: It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.

Cause: Insufficient authentication method was used by the application

Fix: Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form

Difference: Header `Referer` manipulated from: (<http://192.168.10.242:8180/ric-web/servlet/listSendQuery/showUploadSend>) to:
<https://bogus.referrer.hcl.com>

Header `Origin` added to request: <https://bogus.origin.hcl.com>

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Cross-Site Request Forgery

Severity: Medium

CVSS Score: 6.5

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/RicIssue/showRicIssuancePayment>

Entity: showRicIssuancePayment (Page)

Risk: It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.

Cause: Insufficient authentication method was used by the application

Fix: Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form.

Difference: Header Referer manipulated from: http://192.168.10.242:8180/ric-web/servlet/RicIssue/showRicIssuancePayment

to: https://bogus.referer.hcl.com

Header Origin added to request: https://bogus.origin.hcl.com

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Original Response

Cross-Site Request Forgery

Severity:	Medium
CVSS Score:	6.5
CVSS Vector:	AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/ric-web/servlet/registration/searchGroupCode
Entity:	searchGroupCode (Page)
Risk:	It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.
Cause:	Insufficient authentication method was used by the application
Fix:	Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form

Difference: Header `X-Requested-With` removed from request: XMLHttpRequest
 Header `Origin` manipulated from: `http://192.168.10.242:8180` to: `https://bogus.origin.hcl.com`
 Header `Referer` manipulated from: `(http://192.168.10.242:8180/ric-web/servlet/registration/showRegistrationMain` to: `https://bogus.referer.hcl.com`

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Original Response

The screenshot shows a search results page with a table header: #, Mã đơn, Tên đơn, Chủ bối, Thời gian, Trạng thái, Thảo luận. Below the header, there is a message: Không tìm thấy kết quả. Hãy thử tìm kiếm hoặc sử dụng bộ lọc khác. At the bottom left, there is a note: Tổng số 0 đơn. Số hồ sơ mới: 0. A double-equals sign symbol is positioned at the bottom center of the page.

TOC

Cross-Site Request Forgery

Severity:	Medium
CVSS Score:	6.5
CVSS Vector:	AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAX:MAV:X/MAC:X/MPR:X/MUI:X/MS:X/X/NC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/ric-web/servlet/registration/searchInfoPassport
Entity:	searchInfoPassport (Page)
Risk:	It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.
Cause:	Insufficient authentication method was used by the application
Fix:	Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form

Difference: Header `X-Requested-With` removed from request: XMLHttpRequest
Header `Origin` manipulated from: <http://192.168.10.242:8180> to: <https://bogus.origin.hcl.com>
Header `Referer` manipulated from: <http://192.168.10.242:8180/ric-web/servlet/registration/searchInfoPassport> to: <https://bogus.referrer.hcl.com>

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Original Response

Test Response

Cross-Site Request Forgery

Severity: Medium

CVSS Score: 6.5

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/registration/searchPassportRestoreOrLost>

Entity: searchPassportRestoreOrLost (Page)

Risk: It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.

Cause: Insufficient authentication method was used by the application

Fix: Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form

Difference: Header `X-Requested-With` removed from request: XMLHttpRequest

Header `Origin` manipulated from: <http://192.168.10.242:8180> to: <https://bogus.origin.hcl.com>

Header `Referer` manipulated from:

<http://192.168.10.242:8180/ric-web/servlet/registration/showPassportRestoreOrLost/RESTORE> to:

<https://bogus.referer.hcl.com>

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Original Response

Cross-Site Request Forgery

Severity: **Medium**

CVSS Score: 6.5

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/investigationAssignment/showVisaNo>

Entity: showVisaNo (Page)

Risk: It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.

Cause: Insufficient authentication method was used by the application

Fix: Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form

Difference: Header `Referer` manipulated from: <http://192.168.10.242:8180/ric-web/servlet/investigationAssignment/showVisaNo> to: <https://bogus.referer.hcl.com>
Header `Origin` added to request: <https://bogus.origin.hcl.com>

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Original Response

This screenshot shows a user profile page. At the top, there's a navigation bar with links like 'Hồ sơ', 'Trình độ', 'Môn học', 'Quản lý', and 'Mở bài tập hoạt động'. Below the navigation, there's a section titled 'VĂN TÀI & ANH MÃT' with a sub-section 'Thông tin cá nhân'. It displays basic information: Họ tên: Nguyễn Văn A, Ngày sinh: 01/01/1990, Giới tính: Nữ, and Mã sinh viên: 00123456789. There's a large placeholder image for a profile picture. At the bottom right, there's a red button with the text 'Vui lòng khởi chạy ứng dụng windows.' and two small icons.

Test Response

This screenshot is identical to the 'Original Response' above, showing the same user profile details and the same red button at the bottom. The visual similarity suggests that the application did not detect the forged request due to missing security headers.

Issue 31 of 32

TOC

Cross-Site Request Forgery

Severity: Medium

CVSS Score: 6.5

CVSS Vector: AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/registration/searchRptDanhSachHoChieuTheoTrangThai/FAIL>

Entity: FAIL (Page)

Risk: It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated.

Cause: Insufficient authentication method was used by the application

Fix: Validate the value of the "Referer" header, and use a one-time-nonce for each submitted form

Difference: Header `X-Requested-With` removed from request: XMLHttpRequest

Header `Origin` manipulated from: <http://192.168.10.242:8180> to: <https://bogus.origin.hcl.com>

Header `Referer` manipulated from: <http://192.168.10.242:8180/ric-web/servlet/registration/showRptDanhSachHoChieuTheoTrangThai/FAIL> to: <https://bogus.referer.hcl.com>

Reasoning: The test result seems to indicate a vulnerability because the Test Response is identical to the Original Response, indicating that the Cross-Site Request Forgery attempt was successful, even though it included a fictive 'Referer' header.

Original Response

Host Header Injection

Severity:	Medium
CVSS Score:	5.3
CVSS Vector:	AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:N/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/ric-web
Entity:	ric-web (Page)
Risk:	<p>It is possible to deface the site content through web-cache poisoning</p> <p>It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.</p>
Cause:	The web application performs a redirection to an external site
Fix:	Construct HTTP headers very carefully, avoiding the use of non-validated/unsanitized input data

Difference: Header `Host` manipulated from: `192.168.10.242:8180` to: `appscanheaderinjection.com`

Reasoning: The value AppScan injected seems to be included in the response.

Raw Test Response:

```
...
Host: appscanheaderinjection.com
Upgrade-Insecure-Requests: 1
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/120.0.0.0 Safari/537.36
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/avif,image/webp,image/apng,*/*;q=0.8,application/signed-exchange;v=b3;q=0.7
Accept-Language: en-US
Connection: keep-alive
Content-Length: 0

HTTP/1.1 302 Found
Connection: keep-alive
Location: http://appscanheaderinjection.com/ric-web/
Content-Length: 0

...
```

Temporary File Download

Severity:	Medium
CVSS Score:	5.3
CVSS Vector:	AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:N/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/ric-web/servlet/ric/welcome
Entity:	welcome (Page)
Risk:	It is possible to download temporary script files, which can expose the application logic and other sensitive information such as usernames and passwords
Cause:	Temporary files were left in production environment
Fix:	Remove old versions of files from the virtual directory

Difference: Path manipulated from: `/ric-web/servlet/ric/welcome` to: `/ric-web/servlet/ric/welcome.BAC`

Reasoning: The test tried to retrieve a source code file. The fact that the response did not yield an error, and contained non-HTML contents, indicates that the source code retrieval succeeded.

Raw Test Response:

```

CVSS Vector: AV:N/AC:H/PR:N/UI:N/S:U/C:L/I:N/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X

URL: <http://192.168.10.242:8180/ric-web/servlet/investigationAssignment/showVisaNo>

Entity: showVisaNo (Page)

Risk: It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.
It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

Cause: Insecure web application programming or configuration

Fix: Do not accept body parameters that are sent in the query string

Difference: **Body Parameter** removed from request: ~~—~~

Query Parameter added to request:

Body Parameter removed from request: 1

Query Parameter added to request: 1

Body Parameter removed from request:

Query Parameter added to request: ZMB

Method manipulated from: **POST** to: **GET**

The test result seems to indicate a vulnerability, indicating that the application may be susceptible to certain types of attacks.

Reasoning: The test result seems to indicate a vulnerability because the Test Response is similar to the Original Response, indicating that the application processed body parameters that were submitted in the query

Missing "Content-Security-Policy" header

Severity:	Low
CVSS Score:	3.7
CVSS Vector:	AV:N/AC:H/PR:N/UI:N/S:U/C:L/I:N/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/
Entity:	192.168.10.242 (Page)
Risk:	<p>It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.</p> <p>It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations</p>
Cause:	Insecure web application programming or configuration
Fix:	Config your server to use the "Content-Security-Policy" header with secure policies

Difference:

Reasoning: AppScan detected that the Content-Security-Policy response header is missing or with an insecure policy, which increases exposure to various cross-site injection attacks

Raw Test Response:

```
...

Missing HttpOnly Attribute in Session Cookie

Severity:	Low
CVSS Score:	3.7
CVSS Vector:	AV:N/AC:H/PR:N/UI:N/S:U/C:L/I:N/A:N/E:X/RL:X/RC:X/CR:X/IR:X/AR:X/MAV:X/MAC:X/MPR:X/MUI:X/MS:X/MC:X/MI:X/MA:X
URL:	http://192.168.10.242:8180/
Entity:	JSESSIONID (Cookie)
Risk:	It may be possible to steal or manipulate customer session and cookies, which might be used to impersonate a legitimate user, allowing the hacker to view or alter user records, and to perform transactions as that user
Cause:	The web application sets session cookies without the HttpOnly attribute
Fix:	Add the 'HttpOnly' attribute to all session cookies

Difference:

Reasoning: AppScan found that a session cookie is used without the "HttpOnly" attribute.

Original Response

Cause:	Proper bounds checking were not performed on incoming parameter values No validation was done in order to make sure that user input matches the data type expected
Fix:	Verify that parameter values are in their expected ranges and types. Do not output debugging error messages and exceptions

Difference: Parameter `->"pageNo"` manipulated from: `1` to: `%27`

Reasoning: The application has responded with an error message, indicating an undefined state that may expose sensitive information.

Raw Test Response:

```
...
"pageNo": "",
"transactionType": "-1",
"packageCode": "",
"passportTypeSearch": "",
"fromDate": "",
"toDate": "",
"description": ""
}

Fix:	Verify that parameter values are in their expected ranges and types. Do not output debugging error messages and exceptions

Difference: Parameter `->"toDate"` manipulated from: `->"toDate"` to: `__ORIG_VAL__`.

Reasoning: The application has responded with an error message, indicating an undefined state that may expose sensitive information.

Raw Test Response:

```
...

How to Fix

NoSQL Injection

TOC

Cause:

Sanitation of hazardous characters was not performed correctly on user input

Risk:

It is possible to view, modify or delete database entries and tables

The software constructs all or part of a NoSQL DB query using externally influenced input, but fails to neutralize elements that could modify the query when it is sent to the database.

Without sufficient type check or escaping of user-controllable inputs, the generated query can cause those inputs to be interpreted as part of the query instead of ordinary user data.

This can be used to alter query logic to bypass security checks, or to insert additional statements that modify the back-end database, possibly including execution of javascript code on the server.

For example, assume we have an HTML page with a login form, which eventually runs the following MongoDB query on the database using the user input from the following PHP code:

```
db->logins->find(array("username"=>$user, "password"=>$pass));
```

The two variables, \$user and \$pass, contain the user credentials entered by the user in the login form.

If the user has input "jsmith" as the username, and "Demo1234" as the password, the query will look like this:

```
db.logins.find({ username: "jsmith", password: "Demo1234" })
```

But if the user sends "user[\$ne]=1" instead of the user parameter, and "pass[\$ne]=1" instead of the password parameter, the query will look like this (PHP treat user and password parameters as associative array with one element "\$ne" that has 1 as its value):

```
db.logins.find({ username: { $ne: 1 }, password: { $ne: 1 } })
```

Since \$ne is the 'not equals' condition in NoSQL, this query finds all the entries in the logins collection where the username is not equal to 1 and the password is not equal to 1, which means this query will most certainly return all the users in the logins collection. In this scenario, the vulnerability will lead to the attacker being able to log in to the application without a valid username and password.

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

1. To mitigate this issue, cast the parameters received to the proper type (e.g. string).
2. Use objects instead of strings for functions that receive query whenever possible. Otherwise, escape the user input properly.

CWE:

89

Integer Overflow

TOC

Cause:

An Integer Overflow (or wraparound) occurs when a value that is too large is stored (larger than the maximum value the variable can hold) in an integer data type (including byte, short, long, and other types). The most significant bits of the integer are lost, and the remaining value is relative to the minimum value (either 0 or very negative value for signed types).

Risk:

When an integer overflow occurs, the interpreted value will appear to have 'wrapped around' past the maximum value and reset back to the minimum value.

The value can unexpectedly become zero or negative. This can have security implications if the value is used to control looping, manage resources (such as memory allocation), or make business logic decisions.

For example, an integer overflow can give money to the customer in addition to their purchases, when the transaction is completed.

In particular, if a mathematical operation results in a number larger than the maximum possible for the integer type, the value wraps around and the variable is set to zero, or negative.

```
i=UINT_MAX+1; // Maximum value for a variable of type unsigned int - 4294967295 (0xffffffff). The result is: i=0
```

Fix Recommendation:

General

Validate all inputs are within an expected range and the sign before relying on their values or using them in arithmetic calculations.

Be sure to check both upper bounds and lower bounds, including negative lower bounds for signed integers (integer overflow is also possible with very large negative numbers).

Use unsigned integers where possible.

Consider using a safe integer-handling library (such as C/C++ SafeInt or IntegerLib).

Consider enabling compiler extensions that prevent some classes of buffer overflows.

Check for SRI (Subresource Integrity) support

[TOC](#)

Cause:

Subresource Integrity is not supported.

Risk:

The user-agent doesn't verify scripts from third-party services. If the third-party service is compromised, the user is left unprotected. Scripts and link tags with sources from another domain do not support integrity checks. This vulnerability can be exploited if the service hosting the script is compromised.

Sample Script Element Not Supporting SRI:

```
<script src="https://example.com/example-framework.js" crossorigin="anonymous"></script>
```

Sample Script Element Supporting SRI:

```
<script src="https://example.com/example-framework.js" integrity="sha384-Li9vy3DqF8tnTXuaAJuML3ky+er10rcgNR/VqsVpcw+ThHmYcwiB1pbOxEbzJr7" crossorigin="anonymous"></script>
```

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

Add Subresource Integrity to every script/link with source not in your domain

W3C Subresource Integrity:

<https://www.w3.org/TR/SRI/>

SRI Hash Generator:

<https://srihash.org>

[Explanation](#)

Cookie with Insecure or Improper or Missing SameSite attribute

TOC

Cause:

Sensitive Cookie with Improper or Insecure or Missing SameSite Attribute

Risk:

Prevent Cookie information leakage by restricting cookies to first-party or same-site context

Attacks can extend to Cross-Site-Request-Forgery (CSRF) attacks if there are no additional protections in place (such as Anti-CSRF tokens).

The SameSite attribute controls how cookies are sent for cross-domain requests.

The attribute may have three values: 'Lax', 'Strict', or 'None'. If 'None' is used, a website may create a cross-domain POST HTTP request to another website, and the browser automatically adds cookies to this request.

This may lead to Cross-Site-Request-Forgery (CSRF) attacks if there are no additional protections in place (such as Anti-CSRF tokens).

Modes and their uses:

'Lax' mode: the cookie will only be sent with a top-level get request.

'Strict' mode: the cookie will not be sent with any cross-site usage even if the user follows a link to another website.

'None' mode: the cookie will be sent with the cross-site requests.

The attribute having: 'Lax' or 'None' must have 'Secure' Flag set and must be transferred over https.

Example - Set-Cookie: key=value; SameSite=Lax; Secure

Setting attribute to 'Strict' is the recommended option.

Example - Set-Cookie: key=value; SameSite=Strict

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

- [1] Review possible solutions for configuring SameSite Cookie attribute to recommended values.
- [2] Restrict Cookies to a first-party or same-site context.
- [3] Verify and set the SameSite attribute of your cookie to Strict, to ensure that the cookie will only be sent in a first-party context.
- [4] Or, if you want to relax the restrictions of first-party context, then verify and set the SameSite attribute of the cookie to Lax with Secure Flag enabled and transferred over HTTPS.

[WASC Threat Classification: Information Leakage](#)
[SameSite Cookies](#)

Cross-Site Request Forgery

TOC

Cause:

- This vulnerability arises because the application allows the user to perform some sensitive action without verifying that the request was sent intentionally.
- An attacker can cause a victim's browser to emit an HTTP request to an arbitrary URL in the application. When this request is sent from an authenticated victim's browser, it will include the victim's session cookie or authentication header. The application will accept this as a valid request from an authenticated user.
- When a web server is designed to receive a request from a client without any mechanism for verifying that it was intentionally sent, an attacker may be able to trick a client into making an unintentional request from a different site, which will be treated as an authentic request by the application. This can be done by submitting a form, loading an image, sending an XMLHttpRequest in JavaScript, and more.
- For example, this IMG tag can be embedded in an attacker's webpage, and the victim's browser will submit a request to retrieve the image. This valid request will be processed by the application, and the browser will not display a broken image. ``. As a result, money is transferred from the victim's account to the attacker, using the victim's session.

Risk:

An attacker can exploit this vulnerability to perform sensitive actions in another user's account, or using their privileges. It may be possible to force an end-user to execute unwanted actions on a web application in which they're currently authenticated. This would allow the attacker to alter user records and to perform transactions as that user. If the user is currently logged-in to the victim site, the request will automatically use the user's credentials such as session cookies, IP address, and other browser authentication methods. Using this method, the attacker forges the victim's identity and submits actions on their behalf. The severity of this vulnerability depends on the affected functionality in context of the application. For example, a CSRF attack on a search page is less severe than a CSRF attack on a money-transfer or profile-update page.

Fix Recommendation:

General

Set all session and authentication cookies to include the `SameSite` attribute, setting it to `Strict` or `Lax`. When setting this attribute to `Lax` ensure that no sensitive action can be performed via a `GET` request, as per the HTTP standard.

Use built-in CSRF protection provided by the platform or framework, and ensure to activate it appropriately whether in configuration or code. If your platform does not provide a built-in anti-CSRF mechanism, consider integrating a well-vetted library to implement the protection, such as OWASP CSRGGuard.

Avoid building a custom anti-CSRF implementation, as this can be complicated to achieve correctly without allowing trivial bypass. If you absolutely must do so due to lack of standard library support, you should generate a secure, random and non-predictable token (e.g. GUID v4) on the server and embed it in each HTML form, while binding it to the user's session. Upon receiving the submitted form, verify that the included form token matches the token previously bound to the user. It is also feasible to embed the CSRF token in a designated cookie ('double-submitted cookie'), or even better use a custom request header - when the server receives these together with the submitted form token, it is simple to validate that they match (instead of storing in the user's session).

An alternative approach would be to require user reauthentication for specific actions, to ensure the user's active confirmation. Note that this would substantially impact user experience, so this should be used sparingly and only for especially sensitive actions.

Verify the source of the request by validating the `Origin` header if present, or at least the `Referer` header. Discard sensitive requests that originate from a different site.

Host Header Injection

TOC

Cause:

Lack of input validation and sanitization

Risk:

- Dispatch requests to the first virtual host on the list - Cause a redirect to an attacker-controlled domain - Perform web cache poisoning - Manipulate password reset functionality

A web server commonly hosts several web applications on the same IP address, referring to each application via the virtual host.

In an incoming HTTP request, web servers often dispatch the request to the target virtual host based on the value supplied in the Host or X-Forwarded-Host header.

Sample Exploit:

GET /login.html HTTP/1.1

Host: evilhost.com

Fix Recommendation:

General

Validate and sanitize the user supplied inputs properly

CWE:

644

707

601

External References:

[OWASP - WSTG Latest](#)

[Practical Host header attacks](#)

Temporary File Download

TOC

Cause:

Temporary files were left in production environment

Risk:

It is possible to download temporary script files, which can expose the application logic and other sensitive information such as usernames and passwords

Web servers usually associate Common Gateway Interface (CGI) filename extensions, such as .pl, with a handler, such as Perl. When a URL path ends with .pl, the filename designated in the path is sent to Perl for execution; the file contents are not returned to the browser. However, when the script files are edited in place, the editor may save a backup copy of the edited script with a new file extension, such as .bak, .sav, .old, ~, etc. The web server usually does not have a specific handler for these extensions. If the attacker requests one of these files, the file contents are sent directly to the browser.

It is important to remove these temporary files from under the virtual directory, as they may contain sensitive information that was used for debugging purposes, or they may reveal application logic that is different than the current logic, but may still be exploited.

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

Do not keep backup/temporary versions of files underneath the virtual web server root. This usually happens when editing these files "in place" by editors. Instead, when updating the site, move or copy the files to a directory outside the virtual root, edit them there, and move (or copy) the files back to the virtual root. Make sure that only the files that are actually in use reside under the virtual root.

Autocomplete HTML Attribute Not Disabled for Password Field

TOC

Cause:

Insecure web application programming or configuration

Risk:

It may be possible to bypass the web application's authentication mechanism

The "autocomplete" attribute has been standardized in the HTML5 standard. W3C's site states that the attribute has two states, "on" and "off", and that omitting it altogether is equivalent to setting it to "on".

This page is vulnerable since it does not set the "autocomplete" attribute to "off" for the "password" field in the "input" element.

This may enable an unauthorized user (with local access to an authorized client) to autofill the username and password fields, and thus log in to the site.

Affected Products:

N/A

Fix Recommendation:

General

If the "autocomplete" attribute is missing in the "password" field of the "input" element, add it and set it to "off".

If the "autocomplete" attribute is set to "on", change it to "off".

For example:

Vulnerable site:

```
<form action="AppScan.html" method="get"> Username: <input type="text" name="firstname" /><br /> Password: <input type="password" name="lastname" /> <input type="submit" value="Submit" /> </form>
```

Non-vulnerable site:

```
<form action="AppScan.html" method="get"> Username: <input type="text" name="firstname" /><br /> Password: <input type="password" name="lastname" autocomplete="off"/> <input type="submit" value="Submit" /> </form>
```

Body Parameters Accepted in Query

TOC

Cause:

Insecure web application programming or configuration

Risk:

It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.

GET requests are designed to query the server, while POST requests are for submitting data.

However, aside from the technical purpose, attacking query parameters is easier than body parameters, because sending a link to the original site, or posting it in a blog or comment, is easier and has better results than the alternative - in order to attack a request with body parameters, an attacker would need to create a page containing a form that will be submitted when visited by the victim.

It is a lot harder to convince the victim to visit a page that he doesn't know, than letting him visit the original site. It is therefore not recommended to support body parameters that arrive in the query string.

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

Re-program the application to disallow handling of POST parameters that were listed in the Query

CWE:

200
693

GET
POST

Missing "Content-Security-Policy" header

TOC

Cause:

Insecure web application programming or configuration

Risk:

It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.

The absence or improper values of CSP can cause the web application being vulnerable to XSS, clickjacking, etc.

The "Content-Security-Policy" header is designed to modify the way browsers render pages, and thus to protect from various cross-site injections, including Cross-Site Scripting. It is important to set the header value correctly, in a way that will not prevent proper operation of the web site. For example, if the header is set to prevent execution of inline JavaScript, the web site must not use inline JavaScript in its pages.

To protect against Cross-Site Scripting, Cross-Frame Scripting and clickjacking, it is important to set the following policies with proper values: Both of 'default-src' and 'frame-ancestors' policies, *OR* all of 'script-src', 'object-src' and 'frame-ancestors' policies.

For 'default-src', 'script-src' and 'object-src', insecure values such as "*", 'data:', 'unsafe-inline' or 'unsafe-eval' should be avoided.

For 'frame-ancestors', insecure values such as "*" or 'data:' should be avoided.

Additionally for 'script-src', and 'default-src' (fallback directive for 'script-src') 'self' is considered insecure and should be avoided.

Please refer the following links for more information.

Please note that "Content-Security-Policy" includes four different tests. A general test that verifies if the "Content-Security-Policy" header is being used and three additional tests that check if "Frame-Ancestors", "Object-Src" and "Script-Src" were configured correctly.

Affected Products:

This issue may affect different types of products

Fix Recommendation:

General

Configure your server to send the "Content-Security-Policy" header.

It is recommended to configure Content-Security-Policy header with secure values for its directives as below:

For 'default-src', and 'script-src' secure values such as 'none', or https://any.example.com.

For 'frame-ancestors', and 'object-src' secure values such as 'self', 'none' or https://any.example.com are expected.

"unsafe-inline" and "unsafe-eval" must not be used in any circumstance. Using nonce / hash would be only considered for short-term workaround.

For Apache, see:

http://httpd.apache.org/docs/2.2/mod/mod_headers.html

For IIS, see:

<https://technet.microsoft.com/pl-pl/library/cc753133%28v=ws.10%29.aspx>

For nginx, see:

Missing HttpOnly Attribute in Session Cookie

TOC

Cause:

The web application sets session cookies without the HttpOnly attribute

Risk:

It may be possible to steal or manipulate customer session and cookies, which might be used to impersonate a legitimate user, allowing the hacker to view or alter user records, and to perform transactions as that user

During the application test, it was detected that the tested web application set a session cookie without the "HttpOnly" attribute. Since this session cookie does not contain the "HttpOnly" attribute, it might be accessed by a malicious script injected to the site, and its value can be stolen. Any information stored in session tokens may be stolen and used later for identity theft or user impersonation.

Affected Products:

This issue may affect different types of products

Fix Recommendation:

General

Basically the only required attribute for the cookie is the "name" field.

Common optional attributes are: "comment", "domain", "path", etc.

The "HttpOnly" attribute must be set accordingly in order to prevent session cookies from being accessed by scripts.

CWE:

653

Missing or insecure "X-Content-Type-Options" header

TOC

Cause:

Insecure web application programming or configuration

Risk:

It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.

The "X-Content-Type-Options" header (with "nosniff" value) prevents IE and Chrome from ignoring the content-type of a response.

This action may prevent untrusted content (e.g. user uploaded content) from being executed on the user browser (after a malicious naming, for example).

Affected Products:

This issue may affect different types of products

Fix Recommendation:

General

Configure your server to send the "X-Content-Type-Options" header with value "nosniff" on all outgoing requests.

For Apache, see:

http://httpd.apache.org/docs/2.2/mod/mod_headers.html

For IIS, see:

<https://technet.microsoft.com/pl-pl/library/cc753133%28v=ws.10%29.aspx>

For nginx, see:

http://nginx.org/en/docs/http/ngx_http_headers_module.html

CWE:

200

693

List of useful HTTP headers

Reducing MIME type security risks

Missing or insecure Cross-Frame Scripting Defence

TOC

Cause:

Insecure web application programming or configuration

Risk:

It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.

Cross-Frame Scripting is an attack technique where an attacker loads a vulnerable application in an iFrame on his malicious site. The attacker can then launch a Clickjacking attack, which may lead to Phishing, Cross-Site Request Forgery, sensitive information leakage, and more.

For best protection, it is advised to set the header value to DENY or SAMEORIGIN.

Sample Exploit:

Within a malicious site, it is possible to embed the vulnerable page:

```
<frame src="http://vulnerable.com/login.html">
```

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

Use the X-Frame-Options to prevent (or limit) pages from being embedded in iFrames. For older browser, include a "frame-breaker" script in each page that should not be framed.

CWE:

1021

External References:

[Cross-Frame Scripting](#)

[Clickjacking](#)

Application Error

TOC

Cause:

- Proper bounds checking were not performed on incoming parameter values
- No validation was done in order to make sure that user input matches the data type expected

Risk:

It is possible to gather sensitive debugging information

If an attacker probes the application by forging a request that contains parameters or parameter values other than the ones expected by the application (examples are listed below), the application may enter an undefined state that makes it vulnerable to attack. The attacker can gain useful information from the application's response to this request, which information may be exploited to locate application weaknesses.

For example, if the parameter field should be an apostrophe-quoted string (e.g. in an ASP script or SQL query), the injected apostrophe symbol will prematurely terminate the string stream, thus changing the normal flow/syntax of the script.

Another cause of vital information being revealed in error messages, is when the scripting engine, web server, or database are misconfigured. Here are some different variants:

- [1] Remove parameter
- [2] Remove parameter value
- [3] Set parameter value to null
- [4] Set parameter value to a numeric overflow (+/- 99999999)
- [5] Set parameter value to hazardous characters, such as ' ' \' \'
- [6] Append some string to a numeric parameter value
- [7] Append "." (dot) or "[]" (angle brackets) to the parameter name

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

- [1] Check incoming requests for the presence of all expected parameters and values. When a parameter is missing, issue a proper error message or use default values.
- [2] The application should verify that its input consists of valid characters (after decoding). For example, an input value containing the null byte (encoded as %00), apostrophe, quotes, etc. should be rejected.
- [3] Enforce values in their expected ranges and types. If your application expects a certain parameter to have a value from a certain set, then the application should ensure that the value it receives indeed belongs to the set. For example, if your application expects a value in the range 10..99, then it should make sure that the value is indeed numeric, and that its value is in 10..99.
- [4] Verify that the data belongs to the set offered to the client.

[5] Do not output debugging error messages and exceptions in a production environment.

In order to disable debugging in ASP.NET, edit your web.config file to contain the following:

```
<compilation  
debug="false"  
/>
```

For more information, see "HOW TO: Disable Debugging for ASP.NET Applications" in:

<http://support.microsoft.com/default.aspx?scid=kb;en-us;815157>

You can add input validation to Web Forms pages by using validation controls. Validation controls provide an easy-to-use mechanism for all common types of standard validation (for example, testing for valid dates or values within a range), plus ways to provide custom-written validation. In addition, validation controls allow you to completely customize how error information is displayed to the user. Validation controls can be used with any controls that are processed in a Web Forms page's class file, including both HTML and Web server controls.

To make sure that all the required parameters exist in a request, use the "RequiredFieldValidator" validation control. This control ensures that the user does not skip an entry in the web form.

To make sure user input contains only valid values, you can use one of the following validation controls:

[1] "RangeValidator": checks that a user's entry (value) is between specified lower and upper boundaries. You can check ranges within pairs of numbers, alphabetic characters, and dates.

[2] "RegularExpressionValidator": checks that the entry matches a pattern defined by a regular expression. This type of validation allows you to check for predictable sequences of characters, such as those in social security numbers, e-mail addresses, telephone numbers, postal codes, and so on.

Important note: validation controls do not block user input or change the flow of page processing; they only set an error state, and produce error messages. It is the programmer's responsibility to test the state of the controls in the code before performing further application-specific actions.

There are two ways to check for user input validity:

1. Test for a general error state:

In your code, test the page's IsValid property. This property rolls up the values of the IsValid properties of all the validation controls on the page (using a logical AND). If one of the validation controls is set to invalid, the page's property will return false.

2. Test for the error state of individual controls:

Loop through the page's Validators collection, which contains references to all the validation controls. You can then examine the IsValid property of each validation control.

** Input Data Validation:

While data validations may be provided as a user convenience on the client-tier, data validation must be performed on the server-tier using Servlets. Client-side validations are inherently insecure because they can be easily bypassed, e.g. by disabling Javascript.

A good design usually requires the web application framework to provide server-side utility routines to validate the following:

[1] Required field

[2] Field data type (all HTTP request parameters are Strings by default)

[3] Field length

[4] Field range

[5] Field options

[6] Field pattern

[7] Cookie values

[8] HTTP Response

A good practice is to implement the above routine as static methods in a "Validator" utility class. The following sections describe an example validator class.

[1] Required field

Always check that the field is not null and its length is greater than zero, excluding leading and trailing white spaces.

Example of how to validate required fields:

```
// Java example to validate required fields public Class Validator { ... public static boolean validateRequired(String value) { boolean isFieldValid = false; if (value != null && value.trim().length() > 0) { isFieldValid = true; } return isFieldValid; } ... } ... String fieldValue = request.getParameter("fieldName"); if (Validator.validateRequired(fieldValue)) { // fieldValue is valid, continue processing request ... }
```

[2] Field data type

In web applications, input parameters are poorly typed. For example, all HTTP request parameters or cookie values are of type String. The developer is responsible for verifying the input is of the correct data type. Use the Java primitive wrapper classes to check if the field value can be safely converted to the desired primitive data type.

Example of how to validate a numeric field (type int):

```
// Java example to validate that a field is an int number public Class Validator { ... public static boolean validateInt(String value) { boolean isFieldValid = false; try { Integer.parseInt(value); isFieldValid = true; } catch (Exception e) { isFieldValid = false; } return isFieldValid; } ... } ... // check if the HTTP request parameter is of type int String fieldValue = request.getParameter("fieldName"); if (Validator.validateInt(fieldValue)) { // fieldValue is valid, continue processing request ... }
```

A good practice is to convert all HTTP request parameters to their respective data types. For example, store the "integerValue" of a request parameter in a request attribute and use it as shown in the following example:

```
// Example to convert the HTTP request parameter to a primitive wrapper data type // and store this value in a request attribute for further processing String fieldValue = request.getParameter("fieldName"); if (Validator.validateInt(fieldValue)) { // convert fieldValue to an Integer Integer integerValue = Integer.getInteger(fieldValue); // store integerValue in a request attribute request.setAttribute("fieldName", integerValue); } ... // Use the request attribute for further processing Integer integerValue = (Integer)request.getAttribute("fieldName"); ...
```

The primary Java data types that the application should handle:

- Byte
- Short
- Integer
- Long
- Float
- Double
- Date

[3] Field length

Always ensure that the input parameter (whether HTTP request parameter or cookie value) is bounded by a minimum length and/or a maximum length.

Example to validate that the length of the userName field is between 8 and 20 characters:

```
// Example to validate the field length public Class Validator { ... public static boolean validateLength(String value, int minLength, int maxLength) { String validatedValue = value; if (!validateRequired(value)) { validatedValue = ""; } return (validatedValue.length() >= minLength && validatedValue.length() <= maxLength); } ... } ... String userName = request.getParameter("userName"); if (Validator.validateRequired(userName)) { if (Validator.validateLength(userName, 8, 20)) { // userName is valid, continue further processing ... } }
```

[4] Field range

Always ensure that the input parameter is within a range as defined by the functional requirements.

Example to validate that the input numberOfChoices is between 10 and 20:

```
// Example to validate the field range public Class Validator { ... public static boolean validateRange(int value, int min, int max) { return (value >= min && value <= max); } ... } ... String fieldValue = request.getParameter("numberOfChoices"); if (Validator.validateRequired(fieldValue)) { if (Validator.validateInt(fieldValue)) { int numberOfChoices = Integer.parseInt(fieldValue); if (Validator.validateRange(numberOfChoices, 10, 20)) { // numberOfChoices is valid, continue processing request ... } }}
```

[5] Field options

Often, the web application presents the user with a set of options to choose from, e.g. using the SELECT HTML tag, but fails to perform server-side validation to ensure that the selected value is one of the allowed options. Remember that a malicious user can easily modify any option value. Always validate the selected user value against the allowed options as defined by the functional requirements.

Example to validate the user selection against a list of allowed options:

```
// Example to validate user selection against a list of options public Class Validator { ... public static boolean validateOption(Object[] options, Object value) { boolean isValidValue = false; try { List list = Arrays.asList(options); if (list != null) { isValidValue = list.contains(value); } } catch (Exception e) { } return isValidValue; } ... } ... // Allowed options String[] options = {"option1", "option2", "option3"}; // Verify that the user selection is one of the allowed options String userSelection = request.getParameter("userSelection"); if (Validator.validateOption(options, userSelection)) { // valid user selection, continue processing request ... }
```

[6] Field pattern

Always check that the user input matches a pattern as defined by the functionality requirements. For example, if the userName field should only allow alpha-numeric characters, case insensitive, then use the following regular expression:

^[a-zA-Z0-9]*\$

Java 1.3 or earlier versions do not include any regular expression packages. Apache Regular Expression Package (see Resources below) is recommended for use with Java 1.3 to resolve this lack of support.

Example to perform regular expression validation:

```
// Example to validate that a given value matches a specified pattern // using the Apache regular expression package import org.apache.regexp.RE; import org.apache.regexp.RESyntaxException; public Class Validator { ... public static boolean matchPattern(String value, String expression) { boolean match = false; if (validateRequired(expression)) { RE r = new RE(expression); match = r.match(value); } return match; } ... } ... // Verify that the userName request parameter is alpha-numeric String userName = request.getParameter("userName"); if (Validator.matchPattern(userName, "^[a-zA-Z0-9]*$")) { // userName is valid, continue processing request ... }
```

Java 1.4 introduced a new regular expression package (java.util.regex). Here is a modified version of Validator.matchPattern using the new Java 1.4 regular expression package:

```
// Example to validate that a given value matches a specified pattern // using the Java 1.4 regular expression package import java.util.regex.Pattern; import java.util.regex.Matcher; public Class Validator { ... public static boolean matchPattern(String value, String expression) { boolean match = false; if (validateRequired(expression)) { match = Pattern.matches(expression, value); } return match; } ... }
```

[7] Cookie value

Use the javax.servlet.http.Cookie object to validate the cookie value. The same validation rules (described above) apply to cookie values depending on the application requirements, e.g. validate a required value, validate length, etc.

Example to validate a required cookie value:

```
// Example to validate a required cookie value // First retrieve all available cookies submitted in the HTTP request Cookie[] cookies = request.getCookies(); if (cookies != null) { // find the "user" cookie for (int i=0; i<cookies.length; ++i) { if (cookies[i].getName().equals("user")) { //
```

```
validate the cookie value if (Validator.validateRequired(cookies[i].getValue()) { // valid cookie value, continue processing request ... } } } }  
[8] HTTP Response  
[8-1] Filter user input
```

To guard the application against cross-site scripting, sanitize HTML by converting sensitive characters to their corresponding character entities. These are the HTML sensitive characters:

```
< > " ' % ; ) ( & +
```

Example to filter a specified string by converting sensitive characters to their corresponding character entities:

```
// Example to filter sensitive data to prevent cross-site scripting public Class Validator { ... public static String filter(String value) { if (value == null) { return null; } StringBuffer result = new StringBuffer(value.length()); for (int i=0; i<value.length(); ++i) { switch (value.charAt(i)) { case '<': result.append("<"); break; case '>': result.append(">"); break; case "'": result.append(""); break; case '\"': result.append(""); break; case '%': result.append("%"); break; case ';': result.append(";"); break; case '(': result.append("("); break; case ')': result.append(")"); break; case '&': result.append("&"); break; case '+': result.append("+"); break; default: result.append(value.charAt(i)); break; } } ... } ... // Filter the HTTP response using Validator.filter PrintWriter out = response.getWriter(); // set output response out.write(Validator.filter(response)); out.close();
```

The Java Servlet API 2.3 introduced Filters, which supports the interception and transformation of HTTP requests or responses.

Example of using a Servlet Filter to sanitize the response using Validator.filter:

```
// Example to filter all sensitive characters in the HTTP response using a Java Filter. // This example is for illustration purposes since it will filter all content in the response, including HTML tags! public class SensitiveCharsFilter implements Filter { ... public void doFilter(ServletRequest request, ServletResponse response, FilterChain chain) throws IOException, ServletException { PrintWriter out = response.getWriter(); ResponseWrapper wrapper = new ResponseWrapper((HttpServletResponse)response); chain.doFilter(request, wrapper); CharArrayWriter caw = new CharArrayWriter(); caw.write(Validator.filter(wrapper.toString())); response.setContentType("text/html"); response.setContentLength(caw.toString().length()); out.write(caw.toString()); out.close(); } ... public class CharResponseWrapper extends HttpServletResponseWrapper { private CharArrayWriter output; public String toString() { return output.toString(); } public CharResponseWrapper(HttpServletRequest response){ super(response); output = new CharArrayWriter(); } public PrintWriter getWriter(){ return new PrintWriter(output); } } }
```

[8-2] Secure the cookie

When storing sensitive data in a cookie, make sure to set the secure flag of the cookie in the HTTP response, using Cookie.setSecure(boolean flag) to instruct the browser to send the cookie using a secure protocol, such as HTTPS or SSL.

Example to secure the "user" cookie:

```
// Example to secure a cookie, i.e. instruct the browser to // send the cookie using a secure protocol Cookie cookie = new Cookie("user", "sensitive"); cookie.setSecure(true); response.addCookie(cookie);
```

RECOMMENDED JAVA TOOLS

The two main Java frameworks for server-side validation are:

[1] Jakarta Commons Validator (integrated with Struts 1.1)

The Jakarta Commons Validator is a powerful framework that implements all the above data validation requirements. These rules are configured in an XML file that defines input validation rules for form fields. Struts supports output filtering of dangerous characters in the [8] HTTP Response by default on all data written using the Struts 'bean:write' tag. This filtering may be disabled by setting the 'filter=false' flag.

Struts defines the following basic input validators, but custom validators may also be defined:

required: succeeds if the field contains any characters other than white space.

mask: succeeds if the value matches the regular expression given by the mask attribute.

range: succeeds if the value is within the values given by the min and max attributes ((value >= min) & (value <= max)).

maxLength: succeeds if the field is length is less than or equal to the max attribute.

minLength: succeeds if the field is length is greater than or equal to the min attribute.

byte, short, integer, long, float, double: succeeds if the value can be converted to the corresponding primitive.

date: succeeds if the value represents a valid date. A date pattern may be provided.

creditCard: succeeds if the value could be a valid credit card number.

e-mail: succeeds if the value could be a valid e-mail address.

Example to validate the userName field of a loginForm using Struts Validator:

```
<form-validation> <global> ... <validator name="required" classname="org.apache.struts.validator.FieldChecks" method="validateRequired"> msg="errors.required"> </validator> <validator name="mask" classname="org.apache.struts.validator.FieldChecks" method="validateMask"> msg="errors.invalid"> </validator> ... </global> <formset> <form name="loginForm"> <!-- userName is required and is alpha-numeric case insensitive --> <field property="userName" depends="required,mask"> <!-- message resource key to display if validation fails --> <msg name="mask" key="login.userName.maskmsg"/> <arg0 key="login.userName.displayname"/> <var> <var-name>mask</var-name> <var-value>^a-zA-Z0-9*$</var-value> </var> </field> ... </form> ... </formset> </form-validation>
```

[2] JavaServer Faces Technology

JavaServer Faces Technology is a set of Java APIs (JSR 127) to represent UI components, manage their state, handle events and input validation.

The JavaServer Faces API implements the following basic validators, but custom validators may be defined:

validate_doubleRange: registers a DoubleRangeValidator on a component

validate_length: registers a LengthValidator on a component

validate_longRange: registers a LongRangeValidator on a component

validate_required: registers a RequiredValidator on a component

validate_stringRange: registers a StringRangeValidator on a component

validator: registers a custom Validator on a component

The JavaServer Faces API defines the following UIInput and UIOutput Renderers (Tags):

input_date: accepts a java.util.Date formatted with a java.text.Date instance

output_date: displays a java.util.Date formatted with a java.text.Date instance
 input_datetime: accepts a java.util.Date formatted with a java.text.DateTime instance
 output_datetime: displays a java.util.Date formatted with a java.text.DateTime instance
 input_number: displays a numeric data type (java.lang.Number or primitive), formatted with a java.text.NumberFormat
 output_number: displays a numeric data type (java.lang.Number or primitive), formatted with a java.text.NumberFormat
 input_text: accepts a text string of one line.
 output_text: displays a text string of one line.
 input_time: accepts a java.util.Date, formatted with a java.text.DateFormat time instance
 output_time: displays a java.util.Date, formatted with a java.text.DateFormat time instance
 input_hidden: allows a page author to include a hidden variable in a page
 input_secret: accepts one line of text with no spaces and displays it as a set of asterisks as it is typed
 input_textarea: accepts multiple lines of text
 output_errors: displays error messages for an entire page or error messages associated with a specified client identifier
 output_label: displays a nested component as a label for a specified input field
 output_message: displays a localized message

Example to validate the userName field of a loginForm using JavaServer Faces:

```
<%@ taglib uri="https://docs.oracle.com/javaee/6/tutorial/doc/glxce.html" prefix="h" %> <%@ taglib uri="http://mrbool.com/how-to-create-a-login-validation-with-jsf-java-server-faces/27046" prefix="f" %> ... <jsp:useBean id="UserBean" class="myApplication.UserBean" scope="session" /> <f:use_faces> <h:form formName="loginForm" > <h:input_text id="userName" size="20" modelReference="UserBean.userName"> <f:validate_required/> <f:validate_length minimum="8" maximum="20"/> </h:input_text> <!-- display errors if present --> <h:output_errors id="loginErrors" clientId="userName"/> <h:command_button id="submit" label="Submit" commandName="submit" /><p> </h:form> </f:use_faces>
```

** Error Handling:

Many J2EE web application architectures follow the Model View Controller (MVC) pattern. In this pattern a Servlet acts as a Controller. A Servlet delegates the application processing to a JavaBean such as an EJB Session Bean (the Model). The Servlet then forwards the request to a JSP (View) to render the processing results. Servlets should check all input, output, return codes, error codes and known exceptions to ensure that the expected processing actually occurred.

While data validation protects applications against malicious data tampering, a sound error handling strategy is necessary to prevent the application from inadvertently disclosing internal error messages such as exception stack traces. A good error handling strategy addresses the following items:

- [1] Defining Errors
- [2] Reporting Errors
- [3] Rendering Errors
- [4] Error Mapping
- [1] Defining Errors

Hard-coded error messages in the application layer (e.g. Servlets) should be avoided. Instead, the application should use error keys that map to known application failures. A good practice is to define error keys that map to validation rules for HTML form fields or other bean properties. For example, if the "user_name" field is required, is alphanumeric, and must be unique in the database, then the following error keys should be defined:

- (a) ERROR_USERNAME_REQUIRED: this error key is used to display a message notifying the user that the "user_name" field is required;
- (b) ERROR_USERNAME_ALPHANUMERIC: this error key is used to display a message notifying the user that the "user_name" field should be alphanumeric;
- (c) ERROR_USERNAME_DUPLICATE: this error key is used to display a message notifying the user that the "user_name" value is a duplicate in the database;
- (d) ERROR_USERNAME_INVALID: this error key is used to display a generic message notifying the user that the "user_name" value is invalid;

A good practice is to define the following framework Java classes which are used to store and report application errors:

- ErrorKeys: defines all error keys

```
// Example: ErrorKeys defining the following error keys: // - ERROR_USERNAME_REQUIRED // - ERROR_USERNAME_ALPHANUMERIC // - ERROR_USERNAME_DUPLICATE // - ERROR_USERNAME_INVALID // ... public Class ErrorKeys { public static final String ERROR_USERNAME_REQUIRED = "error.username.required"; public static final String ERROR_USERNAME_ALPHANUMERIC = "error.username.alphanumeric"; public static final String ERROR_USERNAME_DUPLICATE = "error.username.duplicate"; public static final String ERROR_USERNAME_INVALID = "error.username.invalid"; ... }
```

- Error: encapsulates an individual error

```
// Example: Error encapsulates an error key. // Error is serializable to support code executing in multiple JVMs. public Class Error implements Serializable { // Constructor given a specified error key public Error(String key) { this(key, null); } // Constructor given a specified error key and array of placeholder objects public Error(String key, Object[] values) { this.key = key; this.values = values; } // Returns the error key public String getKey() { return this.key; } // Returns the placeholder values public Object[] getValues() { return this.values; } private String key = null; private Object[] values = null; }
```

- Errors: encapsulates a Collection of errors

```
// Example: Errors encapsulates the Error objects being reported to the presentation layer. // Errors are stored in a HashMap where the key is the bean property name and value is an ArrayList of Error objects. public Class Errors implements Serializable { // Adds an Error object to the Collection of errors for the specified bean property. public void addError(String property, Error error) { ArrayList propertyErrors = (ArrayList)errors.get(property); if (propertyErrors == null) { propertyErrors = new ArrayList(); errors.put(property, propertyErrors); } propertyErrors.put(error); } // Returns true if there are any errors public boolean hasErrors() { return (errors.size > 0); } // Returns the Errors for the specified property public ArrayList getErrors(String property) { return (ArrayList)errors.get(property); } private HashMap errors = new HashMap(); }
```

Using the above framework classes, here is an example to process validation errors of the "user_name" field:

```
// Example to process validation errors of the "user_name" field. Errors errors = new Errors(); String userName = request.getParameter("user_name"); // (a) Required validation rule if (!Validator.validateRequired(userName)) { errors.addError("user_name", new Error(ErrorKeys.ERROR_USERNAME_REQUIRED)); } // (b) Alpha-numeric validation rule else if (!Validator.matchPattern(userName, "[a-zA-Z0-9]*$")) { errors.addError("user_name", new Error(ErrorKeys.ERROR_USERNAME_ALPHANUMERIC)); } else { // (c) Duplicate check validation rule // We assume that there is an existing UserValidationEJB session bean that implements // a checkIfDuplicate() method to verify if the user already exists in the database. try { ... if (UserValidationEJB.checkIfDuplicate(userName)) { errors.addError("user_name", new Error(ErrorKeys.ERROR_USERNAME_DUPLICATE)); } } catch (RemoteException e) { // log the error logger.error("Could not validate user for specified userName: " + userName); errors.addError("user_name", new Error(ErrorKeys.ERROR_USERNAME_DUPLICATE)); } } // set the errors object in a request attribute called "errors" request.setAttribute("errors", errors); ...
```

[2] Reporting Errors

There are two ways to report web-tier application errors:

(a) Servlet Error Mechanism

(b) JSP Error Mechanism

[2-a] Servlet Error Mechanism

A Servlet may report errors by:

- forwarding to the input JSP (having already stored the errors in a request attribute), OR
- calling response.sendError with an HTTP error code argument, OR
- throwing an exception

It is good practice to process all known application errors (as described in section [1]), store them in a request attribute, and forward to the input JSP. The input JSP should display the error messages and prompt the user to re-enter the data. The following example illustrates how to forward to an input JSP (userInput.jsp):

```
// Example to forward to the userInput.jsp following user validation errors RequestDispatcher rd = getServletContext().getRequestDispatcher("/user/userInput.jsp"); if (rd != null) { rd.forward(request, response); }
```

If the Servlet cannot forward to a known JSP page, the second option is to report an error using the response.sendError method with HttpServletResponse.SC_INTERNAL_SERVER_ERROR (status code 500) as argument. Refer to the javadoc of javax.servlet.http.HttpServletResponse for more details on the various HTTP status codes.

Example to return a HTTP error:

```
// Example to return a HTTP error code RequestDispatcher rd = getServletContext().getRequestDispatcher("/user/userInput.jsp"); if (rd == null) { // messages is a resource bundle with all message keys and values response.sendError(HttpServletResponse.SC_INTERNAL_SERVER_ERROR, messages.getMessage(ErrorKeys.ERROR_USERNAME_INVALID)); }
```

As a last resort, Servlets can throw an exception, which must be a subclass of one of the following classes:

- RuntimeException

- ServletException

- IOException

[2-b] JSP Error Mechanism

JSP pages provide a mechanism to handle runtime exceptions by defining an errorPage directive as shown in the following example:

```
<%@ page errorPage="/errors/userValidation.jsp" %>
```

Uncaught JSP exceptions are forwarded to the specified errorPage, and the original exception is set in a request parameter called javax.servlet.jsp.jspException. The error page must include a isErrorPage directive as shown below:

```
<%@ page isErrorPage="true" %>
```

The isErrorPage directive causes the "exception" variable to be initialized to the exception object being thrown.

[3] Rendering Errors

The J2SE Internationalization APIs provide utility classes for externalizing application resources and formatting messages including:

(a) Resource Bundles

(b) Message Formatting

[3-a] Resource Bundles

Resource bundles support internationalization by separating localized data from the source code that uses it. Each resource bundle stores a map of key/value pairs for a specific locale.

It is common to use or extend java.util.PropertyResourceBundle, which stores the content in an external properties file as shown in the following example:

```
##### # ErrorMessages.properties
```

```
#####
##### # required user name error message error.username.required=User name field is
##### required # invalid user name format error.error.username.alphanumeric=User name must be alphanumeric # duplicate user name error message
##### error.username.duplicate=User name {0} already exists, please choose another one ...
```

Multiple resources can be defined to support different locales (hence the name resource bundle). For example, ErrorMessages_fr.properties can be defined to support the French member of the bundle family. If the resource member of the requested locale does not exist, the default member is used. In the above example, the default resource is ErrorMessages.properties. Depending on the user's locale, the application (JSP or Servlet) retrieves content from the appropriate resource.

[3-b] Message Formatting

The J2SE standard class java.util.MessageFormat provides a generic way to create messages with replacement placeholders. A MessageFormat object contains a pattern string with embedded format specifiers as shown below:

```
// Example to show how to format a message using placeholder parameters String pattern = "User name {0} already exists, please choose
another one"; String userName = request.getParameter("user_name"); Object[] args = new Object[1]; args[0] = userName; String message =
MessageFormat.format(pattern, args);
```

Here is a more comprehensive example to render error messages using ResourceBundle and MessageFormat:

```
// Example to render an error message from a localized ErrorMessages resource (properties file) // Utility class to retrieve locale-specific error
messages public Class ErrorMessageResource { // Returns the error message for the specified error key in the environment locale public String
getErrorMessage(String errorKey) { return getErrorMessage(errorKey, defaultLocale); } // Returns the error message for the specified error key
in the specified locale public String getErrorMessage(String errorKey, Locale locale) { return getErrorMessage(errorKey, null, locale); } // Returns
a formatted error message for the specified error key in the specified locale public String getErrorMessage(String errorKey, Object[] args, Locale
locale) { // Get localized ErrorMessageResource ResourceBundle errorMessageResource = ResourceBundle.getBundle("ErrorMessages",
locale); // Get localized error message String errorMessage = errorMessageResource.getString(errorKey); if (args != null) { // Format the
message using the specified placeholders args return MessageFormat.format(errorMessage, args); } else { return errorMessage; } } // default
environment locale private Locale defaultLocale = Locale.getDefaultLocale(); } ... // Get the user's locale Locale userLocale =
request.getLocale(); // Check if there were any validation errors Errors errors = (Errors)request.getAttribute("errors"); if (errors != null &&
errors.hasErrors()) { // iterate through errors and output error messages corresponding to the "user_name" property ArrayList userErrors =
errors.getErrors("user_name"); ListIterator iterator = userErrors.iterator(); while (iterator.hasNext()) { // Get the next error object Error error
= (Error)iterator.next(); String errorMessage = ErrorMessageResource.getErrorMessage(error.getKey(), userLocale); output.write(errorMessage
+ "\r\n"); } }
```

It is recommended to define a custom JSP tag, e.g. displayErrors, to iterate through and render error messages as shown in the above example.

[4] Error Mapping

Normally, the Servlet Container will return a default error page corresponding to either the response status code or the exception. A mapping between the status code or the exception and a web resource may be specified using custom error pages. It is a good practice to develop static error pages that do not disclose internal error states (by default, most Servlet containers will report internal error messages). This mapping is configured in the Web Deployment Descriptor (web.xml) as specified in the following example:

```
<!-- Mapping of HTTP error codes and application exceptions to error pages --> <error-page> <exception-
type>UserValidationException</exception-type> <location>/errors/validationError.html</error-page> </error-page> <error-page> <error-
code>500</exception-type> <location>/errors/internalError.html</error-page> </error-page> <error-page> ... </error-page> ...
```

RECOMMENDED JAVA TOOLS

The two main Java frameworks for server-side validation are:

[1] Jakarta Commons Validator (integrated with Struts 1.1)

The Jakarta Commons Validator is a Java framework that defines the error handling mechanism as described above. Validation rules are configured in an XML file that defines input validation rules for form fields and the corresponding validation error keys. Struts provides internationalization support to build localized applications using resource bundles and message formatting.

Example to validate the userName field of a loginForm using Struts Validator:

```
<form-validation> <global> ... <validator name="required" classname="org.apache.struts.validator.FieldChecks" method="validateRequired"
msg="errors.required"> </validator> <validator name="mask" classname="org.apache.struts.validator.FieldChecks" method="validateMask"
msg="errors.invalid"> </validator> ... </global> <formset> <form name="loginForm"> <!-- userName is required and is alpha-numeric case
insensitive --> <field property="userName" depends="required,mask"> <!-- message resource key to display if validation fails --> <msg
name="mask" key="login.userName.maskmsg"/> <arg0 key="login.userName.displayname"/> <var> <var-name>mask</var-name> <var-
value>^a-zA-Z0-9*$</var-value> </var> </field> ... </form> ... </formset> </form-validation>
```

The Struts JSP tag library defines the "errors" tag that conditionally displays a set of accumulated error messages as shown in the following example:

```
<%@ page language="java" %> <%@ taglib uri="/WEB-INF/struts-html.tld" prefix="html" %> <%@ taglib uri="/WEB-INF/struts-bean.tld"
prefix="bean" %> <html:html> <head> <body> <html:form action="/logon.do"> <table border="0" width="100%"> <tr> <th align="right">
<html:errors property="username"/> <bean:message key="prompt.username"/> </th> <td align="left"> <html:text property="username"
size="16"/> </td> </tr> <tr> <td align="right"> <html:submit><bean:message key="button.submit"/></html:submit> </td> <td align="right">
<html:reset><bean:message key="button.reset"/></html:reset> </td> </tr> </table> </html:form> </body> </html:html>
```

[2] JavaServer Faces Technology

JavaServer Faces Technology is a set of Java APIs (JSR 127) to represent UI components, manage their state, handle events, validate input, and support internationalization.

The JavaServer Faces API defines the "output_errors" UIOutput Renderer, which displays error messages for an entire page or error messages associated with a specified client identifier.

Example to validate the userName field of a loginForm using JavaServer Faces:

```
<%@ taglib uri="https://docs.oracle.com/javaee/6/tutorial/doc/glxce.html" prefix="h" %> <%@ taglib uri="http://mrbool.com/how-to-create-a-
login-validation-with-jsf-java-server-faces/27046" prefix="f" %> ... <jsp:useBean id="UserBean" class="myApplication.UserBean"
scope="session" /> <f:use_faces> <h:form formName="loginForm" > <h:input_text id="userName" size="20"
```

```
modelReference="UserBean.userName"> <f:validate_required/> <f:validate_length minimum="8" maximum="20"/> </h:input_text> <!-- display errors if present --> <h:output_errors id="loginErrors" clientId="userName"/> <h:command_button id="submit" label="Submit" commandName="submit" /><p> </h:form> </f:use_faces>
```

** Input Data Validation:

While data validations may be provided as a user convenience on the client-tier, data validation must always be performed on the server-tier.

Client-side validations are inherently insecure because they can be easily bypassed, e.g. by disabling Javascript.

A good design usually requires the web application framework to provide server-side utility routines to validate the following:

[1] Required field

[2] Field data type (all HTTP request parameters are Strings by default)

[3] Field length

[4] Field range

[5] Field options

[6] Field pattern

[7] Cookie values

[8] HTTP Response

A good practice is to implement a function or functions that validates each application parameter. The following sections describe some example checking.

[1] Required field

Always check that the field is not null and its length is greater than zero, excluding leading and trailing white spaces.

Example of how to validate required fields:

```
// PHP example to validate required fields function validateRequired($input) { ... $pass = false; if (strlen(trim($input))>0){ $pass = true; } return $pass; ... } ... if (validateRequired($fieldName)) { // fieldName is valid, continue processing request ... }
```

[2] Field data type

In web applications, input parameters are poorly typed. For example, all HTTP request parameters or cookie values are of type String. The developer is responsible for verifying the input is of the correct data type.

[3] Field length

Always ensure that the input parameter (whether HTTP request parameter or cookie value) is bounded by a minimum length and/or a maximum length.

[4] Field range

Always ensure that the input parameter is within a range as defined by the functional requirements.

[5] Field options

Often, the web application presents the user with a set of options to choose from, e.g. using the SELECT HTML tag, but fails to perform server-side validation to ensure that the selected value is one of the allowed options. Remember that a malicious user can easily modify any option value. Always validate the selected user value against the allowed options as defined by the functional requirements.

[6] Field pattern

Always check that user input matches a pattern as defined by the functionality requirements. For example, if the userName field should only allow alpha-numeric characters, case insensitive, then use the following regular expression:

`^[a-zA-Z0-9]+$`

[7] Cookie value

The same validation rules (described above) apply to cookie values depending on the application requirements, e.g. validate a required value, validate length, etc.

[8] HTTP Response

[8-1] Filter user input

To guard the application against cross-site scripting, the developer should sanitize HTML by converting sensitive characters to their corresponding character entities. These are the HTML sensitive characters:

`< > " " % ;) (& +`

PHP includes some automatic sanitization utility functions, such as `htmlentities()`:

`$input = htmlentities($input, ENT_QUOTES, 'UTF-8');`

In addition, in order to avoid UTF-7 variants of Cross-site Scripting, you should explicitly define the Content-Type header of the response, for example:

`<?php header('Content-Type: text/html; charset=UTF-8'); ?>`

[8-2] Secure the cookie

When storing sensitive data in a cookie and transporting it over SSL, make sure that you first set the secure flag of the cookie in the HTTP

response. This will instruct the browser to only use that cookie over SSL connections.

You can use the following code example, for securing the cookie:

```
<$php $value = "some_value"; $time = time() + 3600; $path = "/application/"; $domain = ".example.com"; $secure = 1; setcookie("CookieName", $value, $time, $path, $domain, $secure, TRUE); ?>
```

In addition, we recommend that you use the `HttpOnly` flag. When the `HttpOnly` flag is set to `TRUE` the cookie will be made accessible only through the HTTP protocol. This means that the cookie won't be accessible by scripting languages, such as JavaScript. This setting can effectively help to reduce identity theft through XSS attacks (although it is not supported by all browsers).

The `HttpOnly` flag was Added in PHP 5.2.0.

CERT Advisory (CA-1997-25): Sanitizing user-supplied data in CGI scripts

Email Address Pattern Found

TOC

Cause:

Insecure web application programming or configuration

Risk:

It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

Spambots crawl internet sites, set out to find e-mail addresses in order to build mailing lists for sending unsolicited e-mail (spam).

AppScan detected a response containing one or more e-mail addresses, which may be exploited to send spam mail

Furthermore, the e-mail addresses found may be private and thus should not be accessible to the general public.

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

Remove any e-mail addresses from the website so that they won't be exploited by malicious users.

CWE:

359

200

311

[Definition of Spambot \(Wikipedia\)](#)

Internal IP Disclosure Pattern Found

TOC

Cause:

Insecure web application programming or configuration

Risk:

It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

AppScan detected a response containing an internal IP address.

Internal IP is defined as an IP in the following IP ranges:

10.0.0.0 - 10.255.255.255

172.16.0.0 - 172.31.255.255

192.168.0.0 - 192.168.255.255

Internal IP disclosure is valuable for an attacker as it reveals the IP addressing scheme of the internal network. Knowing the IP addressing scheme of the internal network may help an attacker to devise further attacks against the internal network.

Affected Products:

This issue may affect different types of products.

Fix Recommendation:

General

Internal IP is usually exposed in error messages produced by the web-application/server or in HTML/JavaScript comments.

[1] Turn off problematic detailed error messages in the web-application/server.

[2] Make sure relevant patches are installed.

[3] Make sure that Internal IP information is not left in HTML/JavaScript comments.

CWE:

200

497

Missing "Referrer policy" Security Header

TOC

Cause:

Insecure web application programming or configuration

Risk:

It is possible to gather sensitive information about the web application such as usernames, passwords, machine name and/or sensitive file locations

It is possible to persuade a naive user to supply sensitive information such as username, password, credit card number, social security number etc.

The absence or improper values of Referrer Policy can cause URL leak itself, and even sensitive information contained in the URL will be leaked to the cross-site.

This is a part of ruleset to check if Referrer Policy is present and if so to test its configuration. The "Referer Policy" header defines what data is made available in the Referer header, and for navigation and iframes in the destination's (document.referrer). This header is designed to modify the way browsers render pages, and thus to prevent cross-domain Referer leakage. It is important to set the header value correctly, in a way that will not prevent proper operation of the web site.

Referer header is a request header that indicates the site which the traffic originated from. If there is no adequate prevention in place, the URL itself, and even sensitive information contained in the URL will be leaked to the cross-site.

"no-referrer-when-downgrade" and "unsafe-url" are the policies which leaks the Full Url for the ThirdParty Sites. The remaining policies are "no-referrer", "origin", "origin-when-cross-origin", "same-origin", "strict-origin", "strict-origin-when-cross-origin".

Please refer the following links for more information.

Affected Products:

This issue may affect different types of products

Fix Recommendation:

General

Configure your server to send the "Referrer Policy" header.

It is recommended to configure Referrer Policy header with secure values for its directives as below:

"strict-origin-when-cross-origin" offers more privacy. With this policy, only the origin is sent in the Referer header of cross-origin requests.

For Google Chrome, see:

<https://developers.google.com/web/updates/2020/07/referrer-policy-new-chrome-default>

For Firefox , see:

<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Referrer-Policy>.

Potential File Upload

[TOC](#)

Cause:

The software allows the attacker to upload or transfer files of dangerous types (for example, containing malicious code) and unlimited size that could be automatically processed within the product's environment.

Risk:

It is possible to deface the site by overwriting existing files, or even execute arbitrary code by uploading script files or binaries and tricking the server into executing them.
A malicious file such as a Unix shell script, a windows virus, an Excel file with a dangerous formula, or a reverse shell can be uploaded on the server in order to execute code by an administrator or webmaster later – on the victim's machine.
It is possible to upload huge files this can lead to a Denial of Service by exhausting available storage space.
The web server can be compromised by uploading and executing a web-shell which can run commands, browse system files, browse local resources, attack other servers and etc.

Exploit Example:

The file upload mechanism allows attackers to upload files containing malicious code to the server.
Original request with legitimate file

```
[REQUEST]
POST /page/upload2 HTTP/1.1
Host: mywebsite.com
Content-Type: multipart/form-data;
boundary=-----5079190181930805339849000857

-----5079190181930805339849000857
Content-Disposition: form-data; name="upload_file"; filename="image.jpg"
Content-Type: image/jpg
....
-----5079190181930805339849000857--
```

```
[RESPONSE]
```

The attacker uploads a malicious shell file using the application's file upload feature, The system does not perform any validation and the malicious file is successfully uploaded to the server

```
[REQUEST]
POST /page/upload2 HTTP/1.1
Host: mywebsite.com
Content-Type: multipart/form-data;
boundary=-----5079190181930805339849000857

-----5079190181930805339849000857
Content-Disposition: form-data; name="upload_file"; filename="evilScript.php.jpg"
Content-Type: image/jpg
<?php
    system($_GET['cmd']);
?>
-----5079190181930805339849000857--
```

```
[RESPONSE]
```

Fix Recommendation:

General

The file types allowed to be uploaded should be restricted to only those that are necessary for business functionality.

Limit the filename length and the file size to a maximum value.

It is recommended to generate filenames with a specific algorithm, for example by randomizing them.

Never accept a filename and its extension directly without having an allow list filter.

The application should perform filtering and content checking on any files which are uploaded to the server. Files should be thoroughly scanned and validated before being made available to other users.

Uploaded directory should not have any "execute" permission and all the script handlers should be removed from these directories.

Store files in an external directory.

Use anti automation mechanism to prevent uploads from bots and scripts.

```
/**
 * ajax form validator - jQuery plugin
 *
 * @Author bright_zheng
 * @Version 1.0
 *
 * Usage:
 * 1. by default, we can just bind this to onclick event of the form's submit button
 *
 *      something like this:
 *      <input type="button" onclick="$(this).ajaxFormValidator();">Find Hotels</input>
 *
 * 2. we can customize the behaviors like:
 *     1) beforeFormValidate, by defining a new method like this to override the default:
 *         $.fn.ajaxFormValidator.beforeFormValidate = function(xhr){
 *             //the param xhr is the XMLHttpRequest instance so we can customize the header etc.
 *         }
 *     2) afterFormValidate, by defining a new method like this to override the default:
 *         $.fn.ajaxFormValidator.afterFormValidate = function(form, errors){
 *         }
 * 3) and then use it as normal,
 *      <input type="button" onclick="$(this).ajaxFormValidator();">Find Hotels</input>
 */
(function($){
    $.fn.ajaxFormValidator = function(options){
        var defaults = {
